Introduction

The structure of the disturbed region behind moving bodies in collisionless plasma for the sphere and for the infinitely long circular cylinder has been reported by Liu[1] and by Jew[2] where results of self-consistent numerical solutions are given in graphical form. In the set of tables here, additional information contained in the whole set of near wake points as originally computed will be presented in order that it be available to research workers who may have need of these more precise results in their studies.

Self-Consistent Calculation

The theory accounts for the electrostatic field effects of space charge and body surface potential as well as the influence of the potential field on the ion motion. The calculation considers a moving body of dimension R with a constant negative surface potential, ϕ_s, immersed in a rarefied plasma of singly charged positive ions and electrons. The free stream plasma is considered to be in bithermal equilibrium, having an electron temperature T_e and an ion temperature T_i. It is assumed

that the body speed V lies between the ambient ion thermal speed C_i and the electron thermal speed C_e, i. e., $C_i < V \ll C_e$. It is further assumed that the body surface absorbs electrons and neutralizes the ions which collide with it. In this model, the smallest collision mean free path is much greater than body size which is larger than the Debye length λ. Magnetic field effects are neglected.

Under the assumptions of negative surface potential $\phi_s < 0$ and $V \ll C_e$ the electron density N_e/N_o with N_o = ambient electron and ion density, can be approximated by the Boltzmann distribution in terms of potential ϕ. The ion distribution function is governed by the collisionless Boltzmann equation coupled with Poisson's equation for field potential ϕ. Using Jeans' theorem (Ogorodnikov[3]; Liu[1]), ion density N_i/N_o can be evaluated (Liu[1]; Jew[2]).

The discretized Dirichlet boundary value problem for the disturbed wake region was solved numerically as described in Liu[1] and in Jew[2], resulting in

$$\frac{N_e}{N_o} \quad , \quad \frac{N_i}{N_o} \quad , \quad \frac{N_e - N_i}{N_o} \quad , \quad \text{and} \quad \frac{e\phi}{KT_e}$$

as functions of coordinates (Z/R, ρ/R) for the sphere and of coordinates (Z/R, Y/R) for the cylinder. See Figure 1 for wake coordinate notation.

Four nondimensional parameters characterize the interaction problem. In terms of these, the following cases have been computed and tabulated:

Tables of Electrostatic Structure of Near Wakes behind Space Probes at the Mesothermal Speeds [4]

These tables give the electron density N_e/N_o, ion density N_i/N_o, net charge density $(N_e - N_i)/N_o$, and potential $e\phi/KT_e$ corresponding to the point $(Z/R, \rho/R)$ or $(Z/R, Y/R)$ in the wake of the sphere or of the cylinder. Numbers in these tables are in floating point, with a mantissa followed by a scale factor: For example,
